## **I. INTENT AND SUMMARY**

### **A. Intent of Part 1 of the Water Quality Control Plan for Enclosed Bays and Estuaries (Part 1)**

It is the goal of the State Water Board to comply with the legislative directive in Water Code §13393 to adopt sediment quality objectives (SQOs). Part 1 integrates chemical and biological measures to determine if the sediment dependent biota are protected or degraded as a result of exposure to toxic pollutants\* in sediment and to protect human health. This plan is not intended to address low dissolved oxygen, pathogens or nutrients including ammonia. This Draft Plan represents the first Phase of the State Water Board's Developmental Effort and focuses primarily on the protection of benthic\* communities in enclosed bays\* and estuaries\*. The State Water Board has committed in Phase II to the refinement of benthic community protection indicators for estuarine waters and the development of an approach to address sediment quality related human health risk associated with consumption of fish tissue.

### **B. Summary of Part 1**

Part 1 includes:

1. Narrative SQOs for the protection of aquatic life and human health;
2. Identification of the beneficial uses that these objectives are intended to protect;
3. A program of implementation that contains:
  - a. Specific indicators, tools and implementation provisions to determine if the sediment quality at a station or multiple stations meets the narrative objectives;
  - b. A description of appropriate monitoring programs; and
  - c. A sequential series of actions that shall be initiated when a sediment quality objective is not met including stressor identification and evaluation of appropriate targets.
4. A glossary that defines all terms denoted by an asterisk

## **II. USE AND APPLICABILITY OF SQOS**

### **A. Ambient Sediment Quality**

The SQOs and supporting tools shall be utilized to assess ambient sediment quality.

## **B. Applicable Waters**

This Plan applies to enclosed bays<sup>1</sup> and estuaries<sup>2</sup> only. This Plan does not apply to ocean waters\* including Monterey Bay, Santa Monica Bay, or inland surface waters\*.

## **C. Applicable Sediments**

Part 1 applies to surficial sediments\* that have been deposited or emplaced below the intertidal zone. This Plan does not apply to:

1. Sediments characterized by less than five percent of fines or substrates composed of gravels, cobbles, or consolidated rock.
2. Sediment as the physical pollutant that causes adverse biological response or community degradation related to burial, deposition, or sedimentation.

## **D. Applicable Discharges**

Part 1 is applicable in its entirety to point source\* discharges. Nonpoint sources\* of toxic pollutants are subject to Chapters II, III, IV, V, and VI.

## **III. BENEFICIAL USES**

Beneficial uses protected by Part 1 and corresponding target receptors are identified in Table 1.

---

<sup>1</sup> ENCLOSED BAYS are indentations along the coast which enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes, but is not limited to: Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

<sup>2</sup> ESTUARIES AND COASTAL LAGOONS are waters at the mouths of streams that serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include, but are not limited to, the Sacramento-San Joaquin Delta as defined by Section 12220 of CWC, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

**Table 1      Beneficial Uses and Target Receptors**

<b>BENEFICIAL USES</b>	<b>TARGET RECEPTORS</b>

Marine Habitat	Benthic Community
Commercial and Sport Fishing	Human Health
Aquaculture	Human Health
Shellfish Harvesting	Human Health

#### **IV. SEDIMENT QUALITY OBJECTIVES**

##### **A.      Aquatic Life – Benthic Community Protection**

Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities in bays and estuaries of California. This narrative objective shall be implemented using the integration of multiple lines of evidence (MLOE) as described in Section V of Part 1.

##### **B.      Human Health**

Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health. This narrative objective shall be implemented as described in Section VI of Part 1.

## **V. BENTHIC COMMUNITY PROTECTION**

### **A. Multiple Lines of Evidence Approach**

The methods and procedures described below shall be used to implement the Narrative Objective described in Section IV.A. These tools are intended to assess the condition of benthic communities relative to potential for exposure to toxic pollutants in sediments. Exposure to toxic pollutants at harmful levels will result in some combination of a degraded benthic community, presence of toxicity, and or elevated concentrations of pollutants in sediment. The assessment of sediment quality shall consist of the measurement and integration of three lines of evidence (LOE). The LOE are:

**Sediment Toxicity:** Sediment toxicity is a measure of the response of invertebrates exposed to surficial sediments under controlled laboratory conditions. The sediment toxicity LOE is used to assess both pollutant related biological effects and exposure. Sediment toxicity tests are of short durations and may not duplicate exposure conditions in natural systems. This LOE provides a measure of exposure to all pollutants present, including non-traditional or unmeasured chemicals.

**Benthic Community Condition:** Benthic community condition is a measure of the species composition, abundance and diversity of the sediment-dwelling invertebrates inhabiting surficial sediments. The benthic community LOE is used to assess impacts to the primary receptors targeted for protection under Section IV.A. Benthic community composition is a measure of the biological effects of both natural and anthropogenic stressors.

**Sediment Chemistry:** Sediment chemistry is the measurement of the concentration of chemicals of concern\* in surficial sediments. The chemistry LOE is used to assess the potential risk to benthic organisms from toxic pollutants in surficial sediments. The sediment chemistry LOE is intended only to evaluate overall exposure risk from chemical pollutants. This LOE does not establish causality associated with specific chemicals.

### **B. Limitations**

None of the individual LOE is sufficiently reliable when used alone to assess sediment quality impacts due to toxic pollutants. Within a given site, the LOEs applied to assess exposure as described in Section V.A. may underestimate or overestimate the risk to benthic communities and do not indicate causality of specific chemicals. The LOEs applied to assess biological effects can respond to stresses associated with natural or physical factors, such as sediment grain size, physical disturbance, or organic enrichment.

Each LOE produces specific information that, when integrated with the other LOEs, provides a more confident assessment of sediment quality relative to the narrative objective. When the exposure and effects tools are integrated, the approach can quantify protection through effects measures and also provide predictive capability through the exposure assessment.

### **C. Water Bodies**

1. The tools described in the Sections V.D. through V.I. are applicable to Euhaline\* Bays and Coastal Lagoons\* south of Point Conception and Polyhaline\* San Francisco Bay that includes the Central and South Bay Areas defined in general by waters south and west of the San Rafael Bridge and north of the Dumbarton Bridge.
2. For all other bays and estuaries where LOE measurement tools are unavailable, station assessment will follow the procedure described in Section V.J.

### **D. Field Procedures**

1. All samples shall be collected using a grab sampler.
2. Benthic samples shall be screened through:
  - a. A 0.5 millimeter (mm)-mesh screen in San Francisco Bay and the Sacramento-San Joaquin Delta;
  - b. A 1.0 mm-mesh screen in all other locations.
3. Surface sediment consisting of the top 2 cm shall be collected for chemistry and toxicity analyses.
4. Bulk sediment chemical analysis will include at a minimum the pollutants identified in Attachment A.

### **E. Laboratory Testing**

All samples will be tested in accordance with U.S. EPA or ASTM methodologies where such methods exist. Analytical tests shall be conducted by laboratories certified by the California Department of Health Services in accordance with Water Code Section 13176.

### **F. Sediment Toxicity**

1. Short Term Survival Tests.  
A minimum of one short-term survival test shall be performed on sediment collected from each station. Acceptable test organisms and methods are summarized in Table 2.

**Table 2 Acceptable Short Term Survival Sediment Toxicity Test Methods**

TEST ORGANISM	EXPOSURE TYPE	DURATION	ENDPOINT*
Eohaustorius estuarius	Whole Sediment	10 days	Survival
Leptocheirus plumulosus	Whole Sediment	10 days	Survival
Rhepoxynius abronius	Whole Sediment	10 days	Survival

2. Sublethal Tests.

A minimum of one sublethal test shall be performed on sediment collected from each station. Acceptable test organisms and methods are summarized in Table 3.

**Table 3      Acceptable Sublethal Sediment Toxicity Test Methods**

TEST ORGANISM	EXPOSURE TYPE	DURATION	ENDPOINT
Neanthes arenaceodentata	Whole Sediment	28 days	Growth
Mytilus galloprovincialis	Sediment-water Interface	48 hour	Embryo Development

3. Assessment of Sediment Toxicity.

Each sediment toxicity test result shall be compared and categorized according to responses in Table 4. The response categories are:

Nontoxic: Response not substantially different from that expected in sediments that are uncontaminated and have optimum characteristics for the test species (e.g., control sediments).

Low toxicity: A response that is of relatively low magnitude; the response may not be greater than test variability.

Moderate toxicity: High confidence that a statistically significant toxic effect is present.

High toxicity: High confidence that a toxic effect is present and the magnitude of response includes the strongest effects observed for the test.

4. Use of Supplemental Toxicity Tests.

Additional sediment toxicity tests may be included in the assessment. The design of these tests must be consistent with the narrative objective and approved by the Regional Water Board. Response categories that are consistent with those described in Table 4 and specific to each supplemental test must be available for the test to be included in the assessment.

**Table 4 Sediment Toxicity Categorization Values**

TEST SPECIES/ENDPOINT	STATISTICAL SIGNIFICANCE	NONTOXIC (PERCENT)	LOW TOXICITY (PERCENT OF CONTROL)	MODERATE TOXICITY (PERCENT OF CONTROL)	HIGH TOXICITY (PERCENT OF CONTROL)
Eohaustorius Survival	Significant	90 to 100	82 to 89	59 to 81	< 59
Eohaustorius Survival	Not Significant	82 to 100	59 to 81		<59
Leptocheirus Survival	Significant	90 to 100	78 to 89	56 to 77	<56
Leptocheirus Survival	Not Significant	78 to 100	56 to 77		<56
Rhepoxynius Survival	Significant	90 to 100	83 to 89	70 to 82	< 70
Rhepoxynius Survival	Not Significant	83 to 100	70 to 82		< 70
Neanthes Growth	Significant	90 to 100*	68 to 90	46 to 67	<46
Neanthes Growth	Not Significant	68 to 100	46 to 67		<46
Mytilus Normal	Significant	80 to 100	77 to 79	42 to 76	< 42
Mytilus Normal	Not Significant	77 to 79	42 to 76		< 42

\* Expressed as a percentage of the control.

5. Integration of Sediment Toxicity Categories.

The average of all test response categories shall determine the final toxicity LOE category. If the average falls midway between categories it shall be rounded up to the next higher response category.

**G. Benthic Community Condition**

1. General Requirements.

- All benthic invertebrates in the screened sample shall be identified to the lowest possible taxon and counted.
- Taxonomic nomenclature shall follow current conventions established by local monitoring programs and professional organizations (e.g., master species list).

2. Benthic Indices.

The benthic condition shall be assessed using the following methods:

- Benthic Response Index (BRI), which was originally developed for the southern California mainland shelf and extended into California's bays and estuaries. The BRI is the abundance-weighted average pollution\* tolerance score of organisms occurring in a sample.
- Index of Biotic Integrity (IBI), which was developed for freshwater streams and adapted for California's bays and estuaries. The IBI identifies community measures that have values outside a reference range.
- Relative Benthic Index (RBI), which was developed for embayments in California's Bay Protection and Toxic Cleanup Program. The RBI is the

weighted sum of: (a) several community parameters (total number of species, number of crustacean species, number of crustacean individuals, and number of mollusc species), and abundances of (b) three positive, and (c) two negative indicator species.

- d. River Invertebrate Prediction and Classification System (RIVPACS), which was originally developed for British freshwater streams and adapted for California's bays and estuaries. The approach compares the assemblage at a site with an expected species composition determined by a multivariate predictive model that is based on species relationships to habitat gradients.

### 3. Assessment of Benthic Community Condition.

Each benthic index result shall be categorized according to disturbance as described in Table 5. The disturbance categories are:

Reference: A community composition equivalent to a least affected or unaffected site.

Low disturbance: A community that shows some indication of stress, but could be within measurement error of unaffected condition.

Moderate disturbance: Confident that the community shows evidence of physical, chemical, natural, or anthropogenic stress.

High disturbance: The magnitude of stress is high.

**Table 5 Benthic Index Categorization Values**

INDEX	REFERENCE	LOW DISTURBANCE	MODERATE DISTURBANCE	HIGH DISTURBANCE
Southern California Marine Bays				
BRI	< 39.96	39.96 to 49.14	49.15 to 73.26	> 73.26
IBI	0	1	2	3 or 4
RBI	> 0.27	0.17 to 0.27	0.09 to 0.16	< 0.09
RIVPACS	> 0.90 to < 1.10	0.75 to 0.90 or 1.10 to 1.25	0.33 to 0.74 or > 1.25	< 0.33
Polyhaline Central San Francisco Bay				
BRI	< 22.28	22.28 to 33.37	33.38 to 82.08	> 82.08
IBI	0 or 1	2	3	4
RBI	> 0.43	0.30 to 0.43	0.20 to 0.29	< 0.20
RIVPACS	> 0.68 to < 1.32	0.33 to 0.68 or 1.32 to 1.67	0.16 to 0.32 or > 1.67	< 0.16

### 4. Integration of Benthic Community Categories.

The median of all benthic index response categories shall determine the benthic condition LOE category. If the median falls between categories it shall be rounded up to the next higher effect category.

## H. Sediment Chemistry

1. All samples shall be tested for the analytes identified in Attachment A. This list represents the minimum analytes required to assess exposure. In water bodies where other toxic pollutants are believed to pose risk to benthic communities, those toxic pollutants should be included in the analysis. Inclusion of additional analytes cannot be used in the exposure assessment described below. However, the data can modify the final sediment quality assessment category and assist in stressor identification.

2. Sediment Chemistry Guidelines.

The sediment chemistry exposure shall be assessed using the following two methods:

- a. Chemical Score Index (CSI), that uses a series of empirical thresholds to predict the benthic community disturbance category (score) associated with the concentration of various chemicals (Table 6). The CSI is the weighted sum of the individual scores (Equation 1).

Equation 1.  $CSI = \Sigma(w_i \times cat_i) / \Sigma w$

Where:  $cat_i$  = predicted benthic disturbance category for chemical I;  
 $w_i$  = weight factor for chemical I;  
 $\Sigma w$  = sum of all weights.

- b. California Logistic Regression Model (CA LRM), that uses logistic regression models to predict the probability of sediment toxicity associated with the concentration of various chemicals (Table 7 and Equation 2). The CA LRM exposure value is the maximum probability of toxicity from the individual models ( $P_{max}$ )

Equation 2.  $p = e^{B0+B1(x)} / (1 + e^{B0+B1(x)})$

Where:  $p$  = probability of observing a toxic effect;  
 $B0$  = intercept parameter;  
 $B1$  = slope parameter; and  
 $x$  = concentration the chemical.

**Table 6 Category Score Concentration Ranges and Weighting Factors for the CSI**

CHEMICAL	UNITS	WEIGHT	SCORE (DISTURBANCE CATEGORY)			
			1 REFERENCE	2 LOW	3 MODERATE	4 HIGH
Cadmium	mg/kg	38	≤ 0.09	> 0.09 to 0.22	> 0.22 to 1.66	> 1.66
Copper	mg/kg	100	≤ 52.8	> 52.8 to 96.5	> 96.5 to 406	> 406
Lead	mg/kg	88	≤ 26.4	> 26.4 to 60.8	> 60.8 to 154	> 154
Mercury	mg/kg	30	≤ 0.09	> 0.09 to 0.45	> 0.45 to 2.18	> 2.18
Zinc	mg/kg	98	≤ 112	> 112 to 200	> 200 to 629	> 629
PAHs, total high MW	µg/kg	16	≤ 312	> 312 to 1325	> 1325 to 9320	> 9320
PAHs, total low MW	µg/kg	5	≤ 85.4	> 85.4 to 312	> 312 to 2471	> 2471

DDTs, total	µg/kg	16	≤ 0.50	> 0.50 to 1.52	> 1.52 to 89.3	> 89.3
PCBs, total	µg/kg	55	≤ 11.9	> 11.9 to 24.7	> 24.7 to 288	> 288

**Table 7 CA LRM Regression Parameters**

CHEMICAL	UNITS	B0	B1
Cadmium	mg/kg	0.29	3.18
Copper	mg/kg	-5.59	2.59
Lead	mg/kg	-4.72	2.84
Mercury	mg/kg	-0.06	2.68
Zinc	mg/kg	-5.13	2.42
PAHs, total high MW	ug/kg	-8.19	2.00
PAHs, total low MW	ug/kg	-6.81	1.88
Chlordane, alpha	ug/kg	-3.41	4.46
Dieldrin	ug/kg	-1.83	2.59
Trans nonachlor	ug/kg	-4.26	5.31
PCBs, total	ug/kg	-4.41	1.48
p,p' DDT	ug/kg	-3.55	3.26

3. Assessment of Sediment Chemistry Exposure.

Each sediment chemistry guideline result shall be categorized according to exposure as described in Table 8. The exposure categories are:

Minimal exposure: Sediment-associated contamination\* may be present, but exposure is unlikely to result in effects.

Low exposure: Small increase in pollutant exposure that may be associated with increased effects, but magnitude or frequency of occurrence of biological impacts is low.

Moderate exposure: Clear evidence of sediment pollutant exposure that is likely to result in biological effects; an intermediate category.

High exposure: Pollutant exposure highly likely to result in possibly severe biological effects; generally present in a small percentage of the samples.

**Table 8 Sediment Chemistry Guideline Categorization Values**

GUIDELINE	MINIMAL EXPOSURE	LOW EXPOSURE	MODERATE EXPOSURE	HIGH EXPOSURE
CSI	< 1.69	1.69 to 2.33	2.34 to 2.99	>2.99
CA LRM	< 0.33	0.33 to 0.49	0.50 to 0.66	> 0.66

3. Integration of Sediment Chemistry Categories.

The average of all chemistry exposure categories shall determine the final sediment chemistry LOE category. If the average falls midway between categories it shall be rounded up to the next higher exposure category.

**I. Integration and Interpretation of MLOE**

Assessment as to whether the aquatic life sediment quality objective has been attained at a station is accomplished by the integration of MLOE. The categories assigned to the three LOE, sediment toxicity, benthic community condition and sediment chemistry are evaluated to determine the station level assessment. The assessment category represented by each of the possible MLOE combinations reflects the presence and severity of two characteristics of the sample: severity of biological effects, and potential for chemically-mediated effects.

1. Severity of Biological Effects.

The severity of biological effects present at a site shall be determined by the integration of the toxicity LOE and benthic condition LOE categories using the decision matrix presented in Table 9.

**Table 9 Severity of Biological Effects Matrix**

		TOXICITY LOE CATEGORY			
		NONTOXIC	LOW TOXICITY	MODERATE TOXICITY	HIGH TOXICITY
<b>BENTHIC CONDITION LOE CATEGORY</b>	Reference	Unaffected	Unaffected	Unaffected	Low Effect
	Low Disturbance	Unaffected	Low Effect	Low Effect	Low Effect
	Moderate Disturbance	Moderate Effect	Moderate Effect	Moderate Effect	Moderate Effect
	High Disturbance	Moderate Effect	High Effect	High Effect	High Effect

2. Potential for Chemically-Mediated Effects.

The potential for effects to be chemically-mediated shall be determined by the integration of the toxicity LOE and chemistry LOE categories using the decision matrix presented in Table 10.

**Table 10 Potential for Chemically Mediated Effects Matrix**

		TOXICITY LOE CATEGORY			
		NONTOXIC	LOW TOXICITY	MODERATE TOXICITY	HIGH TOXICITY
<b>SEDIMENT CHEMISTRY LOE CATEGORY</b>	Minimal Exposure	Minimal Potential	Minimal Potential	Low Potential	Moderate Potential
	Low Exposure	Minimal Potential	Low Potential	Moderate Potential	Moderate Potential
	Moderate Exposure	Low Potential	Moderate Potential	Moderate Potential	Moderate Potential
	High Exposure	Moderate Potential	Moderate Potential	High Potential	High Potential

3. Station Level Assessment.

The station level assessment shall be determined using the decision matrix presented in Table 11. This assessment combines the intermediate classifications for severity of biological effect and potential for chemically-mediated effect to result in six categories of impact at the station level:

**Unimpacted:** Confident that sediment contamination is not causing significant adverse impacts to aquatic life living in the sediment at the site.

**Likely Unimpacted:** Sediment contamination at the site is not expected to cause adverse impacts to aquatic life, but some disagreement among the LOE reduces certainty in classifying the site as unimpacted.

**Possibly Impacted:** Sediment contamination at the site may be causing adverse impacts to aquatic life, but these impacts are either small or uncertain because of disagreement among LOE.

**Likely Impacted:** Evidence for a contaminant-related impact to aquatic life at the site is persuasive, even if there is some disagreement among LOE.

**Clearly Impacted:** Sediment contamination at the site is causing clear and severe adverse impacts to aquatic life.

**Inconclusive:** Disagreement among the LOE suggests that either the data are suspect or that additional information is needed before a classification can be made.

The station assessment resulting from each possible combination of the three LOEs is shown in Attachment B. As an alternative to Tables 9, 10 and 11, each LOE category can be applied to Attachment B to determine the overall condition of the station. The results will be the same regardless of the tables used.

**Table 11 Station Assessment Matrix**

		SEVERITY OF EFFECT			
		UNAFFECTED	LOW EFFECT	MODERATE EFFECT	HIGH EFFECT
<b>POTENTIAL FOR CHEMICALLY-MEDIATED EFFECTS</b>	Minimal Potential	Unimpacted	Likely Unimpacted	Likely Unimpacted	Inconclusive
	Low Potential	Unimpacted	Likely Unimpacted	Possibly Impacted	Possibly Impacted
	Moderate Potential	Likely Unimpacted	Possibly Impacted or Inconclusive <sup>1</sup>	Likely Impacted	Likely Impacted
	High Potential	Inconclusive	Likely Impacted	Clearly Impacted	Clearly Impacted

<sup>1</sup> Inconclusive category when chemistry is classified as minimal exposure, benthic response is classified as reference, and toxicity response is classified as high.

4. Relationship to the Aquatic Life – Benthic Community Protection Narrative Objective.

- a. The categories designated as **Unimpacted** and **Likely Unimpacted** shall be considered as achieving the protective condition at the station except as described under b. All other categories shall be considered as degraded.
- b. A Regional Board may designate the category **Possibly Impacted** as meeting the protective condition if studies demonstrate that the combination of effects and exposure measures are not responding to toxic pollutants in sediments and that other factors are causing these responses within a specific reach segment or waterbody. In this situation, the Regional and State Board will consider only the Categories **Likely Impacted** and **Clearly Impacted** as degraded when making a determination on receiving water limits and impaired water bodies described in Section VII.

**J. Application of Aquatic Life – Benthic Community Protection to Other Bays and Estuaries**

Station assessments for waterbodies identified in Section V.C.2. will be conducted using the same conceptual approach and similar tools to those described in Sections V.D-H. Each LOE will be evaluated by measuring a set of readily available indicators in accordance with Tables 12 and 13. Station assessment will also be based on widely-accepted practices in the literature, and be consistent with the key principles of the assessment approach developed for euhaline bays:

- a. Results for a single LOE shall not be used as the basis for an assessment.
- b. Evidence of both elevated chemical exposure and biological effects must be present to indicate pollutant-associated impacts.
- c. The categorization of each LOE shall be based on numeric values or a statistical comparison.

1. Lines of Evidence and Measurement Tools.  
Sediment chemistry, toxicity, and benthic community condition shall be measured at each station. Table 12 lists the recommended tools for evaluation of each LOE. Each measurement shall be conducted using standardized methods (e.g., EPA or ASTM guidance) where available.
2. Categorization of LOEs.  
Determination of the presence of an LOE effect (i.e., biologically significant chemical exposure, toxicity, or benthic community disturbance) shall be based on a comparison to a numeric response value or a statistical comparison to reference stations. The numeric values or statistical comparisons (e.g., confidence interval) used to classify a LOE as Effected should be comparable to those specified in Sections V.F-H. to indicate High Chemical Exposure, High Toxicity, or High Disturbance. Reference stations should be located in an area expected to be uninfluenced by the discharge or pollutants of concern in the assessment area and should be representative of other habitat characteristics of the assessment area (e.g., salinity, grain size). Comparison to reference shall be accomplished by compiling data for appropriate regional reference sites and determining the reference envelope using statistical methods (e.g., tolerance interval).

**Table 12      Tools for Use in Evaluation of LOEs**

LOE	TOOLS	METRICS
Chemistry	Bulk sediment chemistry to include existing list plus other chemicals of concern	CA LRM P <sub>max</sub> Concentration on a dry weight basis
Sediment Toxicity	10-Day amphipod survival using a species tolerant of the sample salinity and grain size characteristics. E.g., <i>Hyaella azteca</i> or <i>Eohaustorius estuarius</i>	Percent of control survival
Benthic Community Condition	Invertebrate species identification and abundance	Species richness Presence of sensitive indicator taxa Dominance by tolerant indicator taxa Presence of diverse functional and feeding groups Total abundance

**Table 13      Numeric Values and Comparison Methods for LOE Categorization**

METRIC	THRESHOLD VALUE OR COMPARISON
CA LRM	$P_{max} > 0.66$
Chemical Concentration	Greater than reference range or interval
Percent of Control Survival	<i>E. estuarius</i> : < 59 <i>H. azteca</i> : < 62 or SWAMP criterion
Species Richness	Less than reference range or interval
Presence of Sensitive Indicator Taxa	Outside of reference range or interval
Dominance by Tolerant Indicator Taxa	Outside of reference range or interval
Total Abundance	Less than reference range or interval

3. Station Level Assessment.

The station level assessment shall be determined using the decision matrix presented in Table 14. This assessment combines the classifications for each LOE to result in two categories of impact at the station level:

**Unimpacted:** No conclusive evidence of both high pollutant exposure and high biological effects present at the site. Evidence of chemical exposure and biological effects may be within natural variability or measurement error.

**Impacted:** Confident that sediment contamination present at the site is causing adverse direct impacts to aquatic life.

**Table 14 Station Assessment Matrix for Other Bays and Estuaries**

CHEMISTRY LOE CATEGORY	TOXICITY LOE CATEGORY	BENTHIC CONDITION LOE CATEGORY	STATION ASSESSMENT
No effect	No effect	No effect	Unimpacted
No effect	No effect	Effect	Unimpacted
No effect	Effect	No effect	Unimpacted
No effect	Effect	Effect	Impacted
Effect	No effect	No effect	Unimpacted
Effect	No effect	Effect	Impacted
Effect	Effect	No effect	Impacted
Effect	Effect	Effect	Impacted

- Relationship to the Aquatic Life – Benthic Community Protection Narrative Objective. The category designated as **Unimpacted** shall be considered as achieving the protective condition at the station.

## **VI. HUMAN HEALTH**

Protection of human health will be assessed based upon a human health risk assessment in accordance with the California Environmental Protection Agency's (Cal/EPA) OEHA policies for fish consumption and risk assessment, Cal/EPA's DTSC Risk Assessment, and U.S. EPA Human Health Risk Assessment policies.

## **VII. PROGRAM OF IMPLEMENTATION**

### **A. Dredge Materials**

- This Plan shall not apply to Dredge material suitability determinations. Suitability determinations shall be based upon USACE and U.S. EPA methodologies developed for ocean, inland and upland disposal, and guidance developed by regional dredging teams and approved by the Regional Water Boards.
- The Regional Water Boards shall not approve a dredging project that involves the dredging of sediment that exceeds the objectives in this plan, unless the Regional Water Boards determine that:
  - The polluted sediment is removed in a manner that prevents or minimizes water quality degradation.

- b. The polluted sediment is not deposited in a location that may cause significant adverse effects to aquatic life, fish, shellfish, or wildlife or may harm the beneficial uses of the receiving waters, or does not create maximum benefit to the people of the State.
- c. The activity will not cause significant adverse impacts upon a federal sanctuary, recreational area, or other waters of significant national importance.

## **B. NPDES Receiving Water and Effluent Limits**

1. If the Regional Board determines that sediment quality in the vicinity of permitted point sources (e.g. within discharge gradient) is potentially at risk, sediment quality objectives may be applied as receiving water limits in the permit.
2. The Permittee shall be in violation of such limits if it is demonstrated that the discharge is causing or contributing to the SQO exceedance as defined in Section VII.C.
3. Receiving water monitoring required by an NPDES permit may be satisfied by a Permittees participation in a regional SQO monitoring program described in Section VII.E.
4. The sediment chemistry guidelines shall not be translated into or applied as effluent limits. Effluent limits established to protect or restore sediment quality shall be developed only after:
  - a. A clear relationship has been established linking the discharge to the degradation,
  - b. The pollutants causing or contributing to the degradation have been identified, and
  - c. Appropriate loading studies have been completed to estimate the reductions in pollutant loading that will restore sediment quality.

These actions are described further in Sections VII.F and VII.G. Nothing in this section shall limit a Regional Boards authority to develop and implement waste\* load allocations\* for Total Maximum Daily Loads. However, it is recommended that Regional Boards develop TMDL allocations using the methodology described herein, wherever possible.

## **C. Exceedance of Receiving Water Limit**

Exceedance of a receiving water limit is demonstrated when, using a binomial distribution\*, the total number of stations designated as not meeting the protective condition as defined in Sections V.I.4. or V.J.4. supports rejection of the null hypothesis\* as presented in Table 15. The stations included in this analysis will be those located in the vicinity and identified in the permit. An exceedance is not a violation until it is demonstrated that the discharge is causing or contributing to the SQO exceedance.

**Table 15 Minimum Number of Measured Exceedances Needed to Exceed the Direct Effects SQO as a Receiving Water Limit**

<b>SAMPLE SIZE</b>	<b>LIST IF THE NUMBER OF EXCEEDANCES EQUALS OR IS GREATER THAN</b>
2 – 24	2*
25 – 36	3
37 – 47	4
48 – 59	5
60 – 71	6
72 – 82	7
83 – 94	8
95 – 106	9
107 – 117	10
118 – 129	11

Note: *Null Hypothesis: Actual exceedance proportion  $\leq$  3 percent. Alternate Hypothesis: Actual exceedance proportion  $>$  18 percent. The minimum effect size\* is 15 percent.*

\*Application of the binomial test requires a minimum sample size of 16. The number of exceedances required using the binomial test at a sample size of 16 is extended to smaller sample sizes.

Exceedance will require the Permittee to perform additional studies as described in Sections VII.F and VII.G.

#### **D. Receiving Water Limits Monitoring Frequency**

1. Phase I Stormwater Discharges and Major Discharges: Sediment Monitoring shall not be required more often than annually or less frequently than twice per permit cycle. For Stations that are consistently classified as unimpacted or likely unimpacted the frequency may be reduced to once per permit cycle. The Regional Board may limit receiving water monitoring to a subset of outfalls for Phase I Stormwater Permittees.
2. Phase II Stormwater and Minor Discharges: Sediment Monitoring shall not be required more often than twice per permit cycle or less than once per permit cycle. For Stations that are consistently classified as unimpacted or likely unimpacted the number of stations monitored may be reduced at the discretion of the Regional Board. The Regional Board may limit receiving water monitoring to a subset of outfalls for Phase II Stormwater Permittees.
3. Other Regulated Discharges and Waivers: The frequency of the monitoring for receiving water limits for other regulated discharges and waivers will be determined by the State or Regional Water Board.

#### **E. Sediment Monitoring**

1. Objective.  
Bedded sediments in bays contain an accumulation of pollutants from a wide variety of past and present sources discharged either directly into the bay or indirectly into waters draining into the bay. Embayments also represent highly disturbed or altered

habitats as a result of dredging and physical disturbance caused by construction and maintenance of harbor works, boat and ship traffic, and development of adjacent lands. Due to the multitude of stressors and the complexity of the environment, a well-designed monitoring program is necessary to ensure that the data collected adequately characterizes the condition of sediment in these water bodies.

2. Permitted Discharges.

Monitoring may be performed by individual Permittees to assess compliance with receiving water limits, or through participation in a regional or water body monitoring coalition as described under VII.E.3, or both as determined by the Regional Water Board.

3. Monitoring Coalitions.

To achieve maximum efficiency and economy of resources, the State Water Board encourages the regulated community in coordination with the Regional Water Boards to establish water body-monitoring coalitions. Monitoring coalitions would enable the sharing of technical resources, trained [personnel](#), and associated costs and create an integrated sediment-monitoring program within each major water body. Focusing resources on regional issues and developing a broader understanding of pollutants effects in these water bodies will enable the development of more rapid and efficient response strategies and enable better management of sediment quality.

- a. Each regional monitoring coalition shall be responsible for sediment quality assessment within the designated waterbody and act cooperatively to ensure that appropriate studies are completed in a timely manner.
- b. Regional Boards shall provide oversight to ensure that participants are proactive and responsive to potential sediment quality related issues as they arise during monitoring and assessment.
- c. Each monitoring coalition shall prepare workplan that describes the monitoring, a map of the stations, participants and a schedule that shall be submitted to the Regional Board for approval.

4. Methods.

Sediments collected from each station shall be tested or assessed using the methods and metrics described in Section 5.

5. Design.

- a. The design of sediment monitoring programs, whether site specific or region wide, shall be based upon a conceptual model. A conceptual model is useful for identifying the physical and chemical factors that control the fate and transport of pollutants and receptors that could be exposed to pollutants in the sediment. The conceptual model serves as the basis for assessing the appropriateness of a study design. The detail and complexity of the conceptual model is dependent upon the scope and scale of the monitoring program. A conceptual model should include:
  - Points of discharge into the segment of the waterbody or region of interest
  - Tidal flow and/or direction of predominant currents
  - Historic and or legacy conditions in the vicinity
  - Nearby land and marine uses or actions

- Beneficial uses
  - Potential receptors of concern
  - Changes in grain size salinity water depth and organic matter
  - Other sources or discharges in the immediate vicinity.
- b. Sediment monitoring programs shall be designed to ensure that the aggregate stations are spatially representative of the sediment within the water body.
  - c. The design shall take into consideration existing data and information of appropriate quality.
  - d. Stratified Random network will provide the most useful information when assessing conditions throughout a water body.
  - e. Identification of appropriate strata shall consider characteristics of the water body including sediment transport, hydrodynamics, depth, salinity, land uses, inputs (both natural and anthropogenic) and other factors that could affect the physical, chemical, or biological condition of the sediment.
  - f. Targeted designs shall be applied to those Permittees that are required to meet receiving water limits as described in Section VII. A.
6. Index Period.  
All stations shall be sampled between the months of June through September to be consistent with the benthic community condition index period.
  7. Regional Monitoring Schedule and Frequency.
    - a. Regional sediment quality monitoring will occur at a minimum of once every three years.
    - b. Sediments identified as exceeding the narrative objective will be evaluated more frequently.
  8. Water Body Assessment of Impairment to the Aquatic Life – Benthic Community.  
The number of stations designated not achieving the protective condition as defined in Section V.I. 4, will be applied as the total number of exceedances when applying the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List. Every effort shall be made to utilize spatially representative stations in this assessment.

## **F. Stressor Identification**

If sediments fail to meet the narrative SQOs in accordance with Section V and VI, a sequential approach is necessary to manage the sediment appropriately. The sequential approach consists of development and implementation of a work plan to seek confirmation and characterization of pollutant-related impacts, pollutant identification and source identification. The workplan shall be submitted to the Regional Board for approval. Stressor identification consists of the following studies:

1. Confirmation and Characterization of Pollutant Related Impacts.

Exceedance of the direct effects SQO at a site indicates that pollutants in the sediment are the cause but does not identify the specific pollutant responsible. The MLOE assessment establishes linkage to sediment pollutants; however, the lack of confounding factors (e.g., physical disturbance, non-pollutant constituents) should be confirmed. There are two generic stressors that are not related to toxic pollutants that may cause the narrative to be exceeded:

Physical Alteration: Examples of physical stressors include reduced salinity, impacts from dredging, very fine or coarse grain size, and prop wash from passing ships. These types of stressors may produce a non-reference condition\* in the benthic community that is similar to that caused by pollutants. If impacts to a site are purely due to physical disturbance, the LOE characteristics will likely show a degraded benthic community with little or no toxicity and low chemical concentrations.

Other Nontoxic Pollutant Related Stressors: These constituents, that include elevated total organic carbon, ammonia, nutrients and pathogens, may have sources similar to chemical pollutants. Chemical and microbiological analysis will be necessary to determine if these constituents are present. The LOE characteristics for this type of stressor would likely be a degraded benthic community with possibly an indication of toxicity, and low chemical concentrations.

To further assess a site that is impacted by toxic pollutants, there are several lines of investigation that may be pursued, depending on site-specific conditions. These studies may be considered and evaluated in the work plan for the confirmation effort.

- a. Evaluate the spatial extent of the Area of Concern. This information can be used to evaluate the potential risk associated with the sediment, distinguish areas of known physical disturbance or pollution and evaluate the proximity to anthropogenic source gradient from such inputs as outfalls, storm drains, and industrial and agricultural activities.
- b. Body burden data may be examined from animals exposed to the site's sediment to indicate if pollutants are being accumulated and to what degree.
- c. Chemical specific mechanistic benchmarks applied to interpret sediment chemistry concentrations.
- d. Chemistry and biology data from the site should be examined to determine if there is a correlation between the two LOE.
- e. Alternate biological effects data may be pursued, such as bioaccumulation\* experiments and pore water toxicity or chemical analysis.
- f. Other investigations that may commonly be performed as part of a Phase 1 Toxicity Identification Evaluation\* (TIE).

If there is compelling evidence that the SQO exceedances contributing to a receiving water limit exceedance are not due to toxic pollutants, then the assessment area shall be designated as having achieved the receiving water limit.

## 2. Pollutant Identification.

Methods to help determine cause may be statistical, biological, chemical or a combination. Pollutant identification studies should be structured to address site-specific conditions, and may be based upon the following:

- a. Statistical methods: Correlations between individual chemicals and biological endpoints (toxicity and benthic community).
  - b. Gradient analysis. Comparisons are made between different samples taken at various distances from a chemical hotspot to examine patterns in chemical concentrations and biological responses. The concentrations of causative agents should decrease as biological effects decrease.
  - c. Additional Toxicity Identification Evaluation efforts: A toxicological method for determining the cause of impairments is the use of toxicity identification evaluations (TIE). Sediment samples are manipulated chemically or physically to remove classes of chemicals or render them biologically unavailable. Following the manipulations, biological tests are performed to determine if toxicity has been removed. TIEs should be conducted at limited number of stations, preferably those with strong biological or toxicological effects.
  - d. Bioavailability\*: Chemical pollutants may be present in the sediment but not biologically available to cause toxicity or degradation of the benthic community. There are several measures of bioavailability that can be made. Chemical and toxicological measurements can be made on pore water to determine the availability of sediment pollutants. Metal compounds may be naturally bound up in the sediment and rendered unavailable by the presence of sulfides. Measurement of acid volatile sulfides and simultaneously extracted metals analysis can be conducted to determine if sufficient sulfides are present to bind the observed metals. Similarly, organic compounds can be tightly bound to sediments. Solid phase microextraction (SPME) or laboratory desorption experiments can be used to identify which organics are available to animals.
  - e. Verification: After specific chemicals are identified as likely causes of impairment, analysis should be performed to verify the results. Sediments can be spiked with the suspected chemicals to verify that they are indeed toxic at the concentrations observed in the field. Alternately, animals can be transplanted to suspected sites for *in situ* toxicity and bioaccumulation testing.
3. Sources Identification and Management Actions.
- a. Determine if ongoing or legacy source.
  - b. Determine number and nature of ongoing sources.
  - c. If a single discharger is found to be responsible for discharging the stressor pollutant at a loading rate that is significant, the Regional Water Board shall require the discharger to take all necessary and appropriate steps to address exceedance of the SQO, including but not limited to reducing the pollutant loading into the sediment.

- d. When multiple sources are present in the water body, that discharge the stressor pollutant at a loading rate that is significant, the Regional Water Board shall require the sources to take all necessary and appropriate steps to address exceedance of the SQO. If appropriate, the Regional Water Board may adopt a TMDL to ensure attainment of the sediment standard.

## **G. Development of Site-Specific Management Guidelines**

In those cases where development of site-specific management guidelines is appropriate (i.e. where toxic stressors have been identified and controllable sources of these stressors exist or remedial goals are desired), guideline development should be considered.

Development of site-specific management guidelines is the process to estimate the level of the stressor pollutant that will meet the narrative sediment quality objective. The guideline could serve as the basis for cleanup goals or revision of effluent limits described in C. 4 above depending upon the situation or sources. Guideline development should only be initiated after the stressor has been identified. The goal is to establish a relationship between the organism's exposure and the biological effect. Although this relationship is not always easy to identify, once this relationship is established a pollutant specific target may be designated that corresponds with minimum biological effects. The following approaches can be applied to establish these relationships:

- a. Correspondence with sediment chemistry. An effective target can best be derived based upon the site-specific, or reach-specific relationship between the stressor pollutant exposure and biological response. Therefore the correspondence between the bulk sediment stressor concentration and biological effects should be examined.
- b. Correspondence with bioavailable pollutant concentration. The concentration of the bioavailable fraction of the stressor pollutants is likely to show a less variable relationship to biological effects than bulk sediment chemistry. Interstitial water analysis, SPME, desorption experiments, selective extractions, or mechanistic models may indicate the bioavailable pollutant concentration. The correspondence between the bioavailable stressor concentration and biological effects should be examined.
- c. Correspondence with tissue residue. The concentration of the stressor accumulated by a target organism may provide a measure of the stressor dose for some chemicals (e.g., those that are not rapidly metabolized). The tissue residue threshold concentration associated with unacceptable biological effects can be combined with a bioaccumulation factor or model to estimate the loading or sediment concentration guideline.
- d. Literature review. If site-specific analyses are ambiguous or unable to determine a guideline then the results of similar development efforts for other areas should be reviewed. Scientific credible values from other studies can be combined with mechanistic or empirical models of bioavailability, toxic potency, and organism sensitivity to estimate targets for the area of interest.

## **VIII. Glossary**

**BENTHIC:** Living on or in bottom of the ocean, bays, and estuaries, or in the streambed.

**BINOMIAL DISTRIBUTION:** Mathematical distribution that describes the probabilities associated with the possible number of times particular outcomes will occur in series of observations (i.e., samples). Each observation may have only one of two possible results (e.g., standard exceeded or standard not exceeded).

**BIOACCUMULATION:** A process in which an organism's body burden of a pollutant exceeds that in its surrounding environment as a result of chemical uptake through all routes of chemical exposure; dietary and dermal absorption and transport across the respiratory surface.

**BIOAVAILABILITY:** Fraction of pollutant an organism is exposed to that is available for uptake through biological membranes (gut, gills).

**CHEMICALS OF CONCERN (COCS):** Pollutants that occur in environmental media at levels that pose a risk to ecological receptors or human health.

**CONTAMINATION:** An impairment of the quality of the waters of the State by waste to a degree that creates a hazard to the public health through poisoning or through the spread of disease. "Contamination" includes any equivalent effect resulting from the disposal of waste whether or not waters of the State are affected (CWC section 13050(k)).

**EFFECT SIZE:** Maximum magnitude of exceedance frequency that is tolerated.

**ENCLOSED BAYS:** Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes, but is not limited to: Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

**ENDPOINT:** A measured response of a receptor to a stressor. An endpoint can be measured in a toxicity test or in a field survey.

**ESTUARIES AND COASTAL LAGOONS:** Waters at the mouths of streams that serve as mixing zones\* for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include, but are not limited to, the Sacramento-San Joaquin Delta as defined by Section 12220 of the California Water Code, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

**EUHALINE:** Waters ranging in salinity from 25–32 practical salinity units (psu).

**INLAND SURFACE WATERS:** All surface waters of the State that do not include the ocean, enclosed bays, or estuaries.

**LOAD ALLOCATION (LA):** The portion of a receiving water's total maximum daily load that is allocated to one of its nonpoint sources of pollution or to natural background sources.

**MIXING ZONE:** Limited zone within a receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

**NONPOINT SOURCES:** Sources that do not meet the definition of a point source as defined below.

**NULL HYPOTHESIS:** Statement used in statistical testing that has been put forward either because it is believed to be true or because it is to be used as a basis for argument, but has not been proved.

**OCEAN WATERS:** Territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Water Board's California Ocean Plan.

**POINT SOURCE:** Any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged. This term does not include agricultural stormwater discharges and return flows from irrigated agriculture.

**POLLUTANT:** Defined in section 502(6) of the CWA as "dredged spoil, solid waste, incinerator residue, filter backwash, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water."

**POLLUTION:** Defined in section 502(19) of the CWA as the "the man-made or man-induced alteration of the chemical, physical, biological, and radiological integrity of water." *Pollution* is also defined in CWC section 13050(1) as an alternation of the quality of the waters of the State by waste to a degree that unreasonably affects either the waters for beneficial uses or the facilities that serve these beneficial uses.

**POLYHALINE:** Waters ranging in salinity from 18–25 psu.

**REFERENCE CONDITION:** The characteristics of water body segments least impaired by human activities. As such, reference conditions can be used to describe attainable biological or habitat conditions for water body segments with common watershed/catchment characteristics within defined geographical regions.

**SURFICIAL SEDIMENTS:** Those materials that extend from the surface of the bedded sediments to a depth of two centimeters. This term is operationally defined to provide consistency in sample collection and data comparability.

**STATISTICAL SIGNIFICANCE:** When it can be demonstrated that the probability of obtaining a difference by chance only is relatively low.

**TOXICITY IDENTIFICATION EVALUATION (TIE):** Techniques used to identify the unexplained cause(s) of toxic events. TIE involves selectively removing classes of

chemicals through a series of sample manipulations, effectively reducing complex mixtures of chemicals in natural waters to simple components for analysis. Following each manipulation the toxicity of the sample is assessed to see whether the toxicant class removed was responsible for the toxicity.

**WASTE:** As used in this document, waste includes a discharger's total discharge, of whatever origin, i.e., gross, not net, discharge.

Attachment A. List of chemical analytes needed to characterize sediment contamination exposure and effect.

CHEMICAL NAME	CHEMICAL GROUP	CHEMICAL NAME	CHEMICAL GROUP
Total Organic Carbon	General	Alpha Chlordane	Pesticide
Percent Fines	General	Gamma Chlordane	Pesticide
		Trans Nonachlor	Pesticide
